01

Foundation of Machine Understanding

Core LLM Concepts

LLM Architecture

Understanding the fundamental structure and design principles of Large Language Models

Context Windows

Learning how context windows affect the model's ability to understand and generate responses

Tokens

Grasping the concept of tokens as the basic units of language in LLMs

Programming Literacy Essentials

Necessity of Python

Recognizing Python's role as a primary language for interacting with LLMs

Basic Model Interaction

Learning the essential programming skills to effectively communicate with language models

02

Core Skills Development

Six Pillars of Prompting

Clarity in Prompts

Ensuring prompts are specific and understandable to guide the model effectively.

Context Utilization

Incorporating relevant context to provide the model with necessary background information.

Constraint Application

Setting boundaries to focus the model's responses and prevent irrelevant outputs.

Delimiter Usage

Employing delimiters to clearly separate different parts of the prompt for better processing.

Role-Play Techniques

Adopting role-play to simulate specific scenarios and elicit targeted responses from the model.

Iterative Prompting

Refining prompts through iterative feedback to improve the quality of responses.

Efficient Prompting Techniques

Zero-Shot to Few-Shot Transition

Moving from no examples to providing a few examples to guide the model's learning process.

Prompt Optimization

Refining prompts to minimize the number of examples needed for accurate responses.

Adaptive Prompting

Adjusting prompts dynamically based on the model's performance to enhance learning efficiency.

03

Advanced Control Techniques

Chain-of-Thought Reasoning

Complex Task Handling

Utilizing CoT for multi-step logic and complex problem-solving

Multi-Step Logic

Applying CoT to guide models through sequential reasoning processes

Self-Correction Mechanisms

Model Self-Critique

Teaching models to evaluate and correct their own outputs

Reflection on Output

Implementing self-correction to enhance the accuracy and reliability of responses

Adversarial Prompting Strategies

Identifying Model Biases

Employing adversarial prompts to expose and address model biases

Mitigating Failure Points

Using adversarial techniques to discover and reduce model failure modes

04

Specialization in SaaSVC

RAG Integration Methods

Integrating external data

RAG Integration involves incorporating external data to provide more grounded and accurate responses.

Grounded responses

This method ensures that the model's responses are based on real-world data, enhancing their relevance and accuracy.

Agentic Design Principles

Prompting for autonomous actions

Agentic Design involves prompting the model to perform autonomous actions, making it more versatile and efficient.

Multi-tool use

This principle encourages the model to use multiple tools, enhancing its ability to handle complex tasks.

Real-World Application Optimization

**ADAPTABILITY TO BUSINESS
LANDSCAPE CHANGES**

Performance in live saasvc environment

This section focuses on optimizing the model's performance in a live saasvc environment, ensuring it functions efficiently and effectively.

Efficiency optimization

The goal is to improve the model's efficiency, making it more responsive and reliable in real-world applications.

THE END

Thank You
