Deployment

01

Foundation of PE Mindset

Necessity in SaaS environment

Establishing the 'Why'

Understanding the importance of PE in SaaS for user engagement and product improvement

User-Centric Approach

Aligning PE with user needs to enhance the SaaS CV experience and satisfaction

Core technical background

LLMs, Tokens, and NLP

Grasping the basics of Large Language Models, tokenization, and Natural Language Processing

Fundamentals of AI

Learning the foundational AI concepts that underpin prompt engineering in SaaS CV

Essential Python skill

Model Interaction

Mastering Python to effectively interact with and manipulate AI models

Data Manipulation

Acquiring skills to handle and preprocess data for model training and inference

02

Mastering Fundamentals

Golden rule: clarity and specificity

Lack of Clarity

Action Verbs

Use precise action verbs to direct the model's response and ensure clarity.

Constraints

Define constraints to guide the model's output and maintain specificity.

Contextual control

Defining Role

Establish the role of the AI to control the context and guide interactions.

Persona and Audience

Specify the persona and audience to tailor the model's communication style.

Prompt patterns understanding

Zero-Shot

Understand zero-shot learning to leverage the model's ability to handle unseen tasks.

Few-Shot

Utilize few-shot learning to provide minimal examples for the model to follow.

Instructional Design

Apply instructional design principles to structure prompts effectively.

03

Advanced Precision Techniques

Chain-of-Thought reasoning

Multi-step reasoning

The power of CoT lies in its ability to perform complex, multi-step reasoning tasks.

Logical progression

CoT enables a logical progression of thought, enhancing the model's ability to solve intricate problems.

Model experimentation and tuning

Experimentation with models

Exploring different models to find the best fit for specific tasks and data.

Tuning parameters

Adjusting temperature and Top-P settings to optimize model performance and output quality.

Iterative loop for refinement

Documentation and testing

Documenting each iteration and rigorously testing to ensure improvements are made.

Refining the playbook

Iteratively refining the process based on outcomes to create a personal playbook for prompt engineering.

Revision Features

04

Specialization and Deployment

RAG and data grounding

Connecting LLMs to saascv

data

Utilizing RAG to link language models with SaaS CV data sources for enhanced context understanding

Data Grounding Importance

Ensuring the relevance and accuracy of data used in prompting by grounding it within the SaaS environment

Multimodal prompting

Combining Text and Image/Video

Employing multimodal prompts to integrate textual information with visual or video content for comprehensive data interpretation

Enhanced Prompting Techniques

Leveraging multimodal prompts to create more nuanced and contextually rich interactions with language models

Building real-world portfolio

Real-world Projects Implementation

Applying prompt engineering skills to actual projects, demonstrating practical applications in the SaaS CV domain

Continuous Learning Approach

Developing a portfolio that reflects ongoing learning and adaptation to new challenges and technologies in the field

THE END

Thank You
